***Abstract** -This paper is devoted to fractional q-derivative of special functions. To begin with the theorem on term by term q-fractional differentiation has been derived. The result is an extension of an earlier result due to Yadav and Purohit [8] and Sharma, Jain and Ali [9]. As a special case, of fractional q-differentiation of Generalized M-series has been obtained.*

DEFINITION:

1.1. Q-ANALOGUE OF DIFFERENTIAL OPERATOR

Al-Salam [3], has given the q-analogue of differential operator as

$$D_q f(x) = \frac{f(xq) - f(x)}{x(q-1)} \tag{1.1}$$

This is an inverse of the q-integral operator defined as

$$\int_x^\infty f(t)\, d(t:q) = x(1-q) \sum_{k=1}^{\infty} q^{-k} f(xq^{-k}) \tag{1.2}$$

Where $0 < |q| < 1$

1.2. FRACTIONAL Q-DERIVATIVE OF ORDER α:

The fractional q-derivative of order α is defined as

$$D_{x,q}^{\alpha} f(x) = \frac{1}{\Gamma_q(-\alpha)} \int_0^x (x - yq)_{-\alpha-1} f(y) d(y;q) \tag{1.2.1}$$

Where Re $(\alpha) < 0$

As a particular case of (1.2.1), we have

$$D_{x,q}^{\alpha} x^{\mu-1} = \frac{\Gamma_q(\mu)}{\Gamma_q(\mu-\alpha)} x^{\mu-\alpha-1} \tag{1.2.2}$$

2. MAIN RESULTS

In this section we drive the results on term by term q-fractional differentiation of a power series. As particular case we will the fractional q-differentiation of the Generalized M-Series and exponential series.

THEOREM 1: If the series ${}_pM_q^{\alpha,\beta}(z)$ converges absolutely for $|q| < \rho$ then

$$D_{z,q}^{\mu}\left\{ z^{\lambda-1} \sum_{k=o}^{\infty} \frac{(a_1)_k \;.\,.\,.\,.\,.\, (a_p)_k}{(b_1)_k \;.\,.\,.\,.\,.\, (b_q)_k} \frac{z^k}{\Gamma(\alpha k+\beta)} \right\} = \sum_{k=o}^{\infty} \frac{(a_1)_k \;.\,.\,.\,.\,.\, (a_p)_k}{(b_1)_k \;.\,.\,.\,.\,.\, (b_q)_k \Gamma(\alpha k+\beta)} D_{z,q}^{\mu} z^{k+\lambda-1} \tag{2.1}$$

Where Re $(\lambda) > 0$, Re $(\mu) < 0$, $0 < |q| < 1$

PROOF: Starting From the left side and using equation (1.2.1), we have

$$D_{z,q}^{\mu}\left\{ z^{\lambda-1} \sum_{k=o}^{\infty} \frac{(a_1)_k \;.\,.\,.\,.\,.\, (a_p)_k}{(b_1)_k \;.\,.\,.\,.\,.\, (b_q)_k} \frac{z^k}{\Gamma(\alpha k+\beta)} \right\}$$
$$= \frac{1}{\Gamma_q(-\mu)} \int_0^z (z - yq)_{-\mu-1}\, y^{\lambda-1} \sum_{k=o}^{\infty} \frac{(a_1)_k \;.\,.\,.\,.\,.\, (a_p)_k}{(b_1)_k \;.\,.\,.\,.\,.\, (b_q)_k} \frac{y^k}{\Gamma(\alpha k+\beta)} d(y;q)$$

$$= \frac{z^{\lambda-\mu-1}}{\Gamma_q(-\mu)} \int_0^1 (1-tq)_{-\mu-1}\, t^{\lambda-1} \sum_{k=o}^{\infty} \frac{(a_1)_k \;.\;.\;.\;.\;.(a_p)_k}{(b_1)_k \;.\;.\;.\;.\;.(b_q)_k} \frac{z^k t^k}{\Gamma(\alpha k+\beta)} d(t;q) \qquad (2.2)$$

Now the following observation are made

(i) $\sum_{k=o}^{\infty} \frac{(a_1)_k \;.\;.\;.\;.\;.(a_p)_k}{(b_1)_k \;.\;.\;.\;.\;.(b_q)_k} \frac{z^k t^k}{\Gamma(\alpha k+\beta)}$ converges absolutely and therefore uniformly on domain of x over the region of integration.

(ii) $\int_0^1 \left|(1-tq)_{-\mu-1} t^{\lambda-1}\right| d(t;q)$ is convergent,
Provided Re $(\lambda) > 0$, Re $(\mu) < 0$, $0 < |q| < 1$

Therefore the order of integration and summation can be interchanged in (2.2) to obtain.

$$= \frac{z^{\lambda-\mu-1}}{\Gamma_q(-\mu)} \sum_{k=o}^{\infty} \frac{(a_1)_k \;.\;.\;.\;.\;.(a_p)_k}{(b_1)_k \;.\;.\;.\;.\;.(b_q)_k} \frac{z^k}{\Gamma(\alpha k+\beta)} \int_0^1 (1-tq)_{-\mu-1}\, t^{\lambda+k-1} d(t;q)$$

$$= \sum_{k=o}^{\infty} \frac{(a_1)_k \;.\;.\;.\;.\;.(a_p)_k}{(b_1)_k \;.\;.\;.\;.\;.(b_q)_k} \frac{1}{\Gamma(\alpha k+\beta)} D_{z,q}^{\mu} z^{k+\lambda-1}$$

Hence the statement (2.1) is proved.

3. Some special cases:

(i) If we take $\alpha = 0, \beta = 0$ in equation (2.1) it becomes the fractional q-derivative of power series.

$$D_{z,q}^{\mu}\left\{z^{\lambda-1} \sum_{k=o}^{\infty} \frac{(a_1)_k \;.\;.\;.\;.\;.(a_p)_k}{(b_1)_k \;.\;.\;.\;.\;.(b_q)_k} z^k \right\} = \sum_{k=o}^{\infty} \frac{(a_1)_k \;.\;.\;.\;.\;.(a_p)_k}{(b_1)_k \;.\;.\;.\;.\;.(b_q)_k} D_{z,q}^{\mu}\{z^{k+\lambda-1}\} \qquad (3.1)$$

This equation (3.1) is known result given by Yadav and Purohit [8] and Ali, Jain and Sharma [9].

(ii) When $\alpha = 1, \beta = 1$ and no upper or lower parameter in(5), we have

$$D_{z,q}^{\mu}\left\{z^{\lambda-1} \sum_{k=o}^{\infty} \frac{z^k}{\Gamma(k+1)} \right\} = \sum_{k=o}^{\infty} \frac{1}{k!} D_{z,q}^{\mu}\{z^{k+\lambda-1}\} \qquad (3.2)$$

Equivalently,

$$D_{z,q}^{\mu}\{z^{\lambda-1} e^z \} = \sum_{k=o}^{\infty} \frac{1}{k!} D_{z,q}^{\mu}\{z^{k+\lambda-1}\} \qquad (3.3)$$

Thus the equation reduces to fractional q-derivative of exponential function.

(iii) If no upper or lower parameter, we have

$$D_{z,q}^{\mu}\left\{z^{\lambda-1} \sum_{k=o}^{\infty} \frac{z^k}{\Gamma(\alpha k+\beta)} \right\} = \sum_{k=o}^{\infty} \frac{1}{\Gamma(\alpha k+\beta)} D_{z,q}^{\mu} z^{k+\lambda-1} \qquad (3.4)$$

or

$$D_{z,q}^{\mu}\{z^{\lambda-1} E_{\alpha,\beta}(z) \} = \sum_{k=o}^{\infty} \frac{1}{\Gamma(\alpha k+\beta)} D_{z,q}^{\mu}\{z^{k+\lambda-1}\} \qquad (3.5)$$

Hence the series convert in fractional q-derivative of Mittag-Lefller function. Thus it is the complete analysis of the statement (2.1).
